

Small Molecules, Cytokines and Growth Factors for Stem Cell Research

Overview

Stemgent's extensive portfolio of small molecules, cytokines and growth factors target the major stem cell signaling pathways aiding stem cell researchers in regulating cellular reprogramming, self-renewal/maintenance and differentiation of pluripotent stem cells. The portfolio includes proprietary all-trans synthetic retinoic acid for regulating neural differentiation. *Newly added* WH-4-023, SB590885 and IM-12 are three kinase inhibitors supporting derivation and maintenance of naïve human pluripotent stem cells as referenced in the October 2014 *Cell Stem Cell* paper by Jaenisch and coworkers titled "Systematic identification of culture conditions for induction and maintenance of naïve human pluripotency."

Extensive Portfolio in Multiple Formats

Recognized worldwide, Stemgent's Stemolecule Portfolio, focuses on small molecules affecting cellular reprogramming of somatic cells to iPS cells, self-renewal/maintenance and differentiation of pluripotent stem cells. Stemgent's portfolio covers small molecules for regulating a number of signaling pathways including TGFβ/BMP, Wnt, Hedgehog, FGF/MAPK and Integrin. Many of the major small molecules including CHIR99021, PD0325901, SB431542 and LDN-193189 are available in multiple sizes and formats including powder and ready-to-use solutions and custom formats.

Proprietary Technology for Regulating Stem Cell Differentiation

ReproCELL's Reinnervate ec23® all-trans synthetic retinoic acid is highly stable, unlike other all-trans retinoic acids that are light and heat sensitive. The stability of ec23 enables the reproducible neural differentiation from pluripotent stem cells.

Features

- Modulate the major stem cell signaling pathways
- Tested negative for cytotoxicity

Small Molecules Supporting Emerging Technologies

Stemgent's new addition of WH-4-023, SB590885 and IM-12 kinase inhibitor small molecules coupled with Stemgent's PD0325901 MEK inhibitor and Y27632 ROCK inhibitor small molecules, Stemfactor human LIF and Stemfactor Activin A cytokines make up the 5i/L/A media supplement described by Theunissen¹ for the self-renewal of naïve human stem cells necessary for ground state pluripotency.
